Subject: Employee Retention Analysis & Strategic Recommendations

Executive Summary

Salifort Motors is experiencing a high rate of employee turnover, resulting in significant costs associated with recruitment, onboarding, and lost productivity. To address this, we analyzed 15,000 employee records and developed a predictive machine learning model to identify flight-risk employees and uncover the structural drivers of attrition. Our final model successfully identifies 92% of employees who are likely to leave, allowing HR to pivot from a reactive to a proactive retention strategy.

Key Findings

The analysis reveals that employee turnover at Salifort Motors is primarily driven by operational workload and tenure stagnation, rather than departmental factors or compensation tiers.

1. **The Burnout Threshold:** Employees logging extreme hours (over 200+ per month) and handling a high volume of concurrent projects (6-7) are leaving at critical rates.
2. **The Underutilization Risk:** Conversely, employees assigned to too few projects (2 or fewer) are also leaving, indicating a lack of engagement or clear responsibilities.
3. **The Four-Year Stagnation:** There is a significant spike in turnover around the four-year mark. Employees reaching this tenure without a recent promotion are highly likely to exit.
4. **Satisfaction is a Symptom:** While departing employees report low satisfaction scores, our model indicates this is a trailing indicator resulting from the workload extremes mentioned above, not the root cause.

Strategic Recommendations

To stabilize retention and reduce associated costs, we recommend implementing the following data-driven initiatives:

- **Institute Workload Caps:** Establish a hard limit on the number of concurrent projects assigned to a single employee. The optimal operational sweet spot is 3 to 4 projects; assignments beyond 5 should require managerial override.

- **Automate Overtime Interventions:** Configure HR systems to automatically flag employees consistently logging over 200 hours per month. Require mandatory check-ins for these individuals to redistribute workload and mitigate immediate burnout risk.
- **Overhaul the 4-Year Milestone:** Audit internal promotion pathways for employees approaching their fourth anniversary. If vertical promotion is unavailable, HR must introduce lateral movement opportunities, targeted upskilling, or tenure-based incentives to disrupt the 4-year attrition spike.
- **Monitor Underutilized Staff:** Identify employees with fewer than 3 projects and ensure they are adequately integrated into active workflows to prevent disengagement.

Conclusion

By treating the structural causes of workload imbalance and tenure stagnation, Salifort Motors can significantly reduce employee turnover. The predictive model developed during this analysis is available for immediate deployment to begin flagging current flight-risk employees for HR intervention.
